

SQUIRREL GLIDER

Being arboreal, Squirrel Gliders are very good climbers. They are able to glide from tree to tree using the membranes of skin that stretch between their front and back legs.

They have been observed to glide up to 100 metres with the assistance of a downhill slope and up to 50 metres over flatter terrain.

Squirrel Gliders take shelter in tree hollows during the day and come out at night, being nocturnal. They have large, light sensitive eyes that allow for increased night vision.
